***Hundreds of APIs = Trillions of Connections***

# *Challenges with the Management of APIs & Microservices*

## **APIs**

- **Multiple API Version Control**
- **Discovering and Management of Distributed APIs is #@%!@**
- **Multi-Cloud Secure API Communications**
- **Traffic Management & Scaling**

## **Microservices**

- **Microservices Increases complexity of end to end API visibility**
- **Webhook Development, Visibility and Security**
- **Testing Mobile Apps on Laptop & Dev Machines with Visibility & Security**
- **Distributed API AuthZ/AuthZ is @#%@%**

# *State of the Union*

- **Service Mesh logging, observability and API Management designed around single cluster.**
- **Distributed Apps require common API Frameworks to deploy, manage and observe heterogeneous environments**
- **Emerging Cloud Native Edge Requirements**
- **Complex solutions for API delivery to large # of branches / SOHO**
- **Developer solutions have limited visibility and security, e2e not available across fleet**
- **Before commit & merge, no easy workflow to deploy a local instance of sw on dev cluster**

# *Where Do We Need to Go?*

*A universal stack for API discovery, control & delivery  
that's centrally managed but globally distributed*

# A New Approach Is Needed

## APP2APP NEEDS

A single L3-L7 Network & Security Services Stack

Consolidated Service

SaaS-based Operations

Common Tooling Across Environments

Centralized Policy & Observability

NetOps

DevOps

SecOps

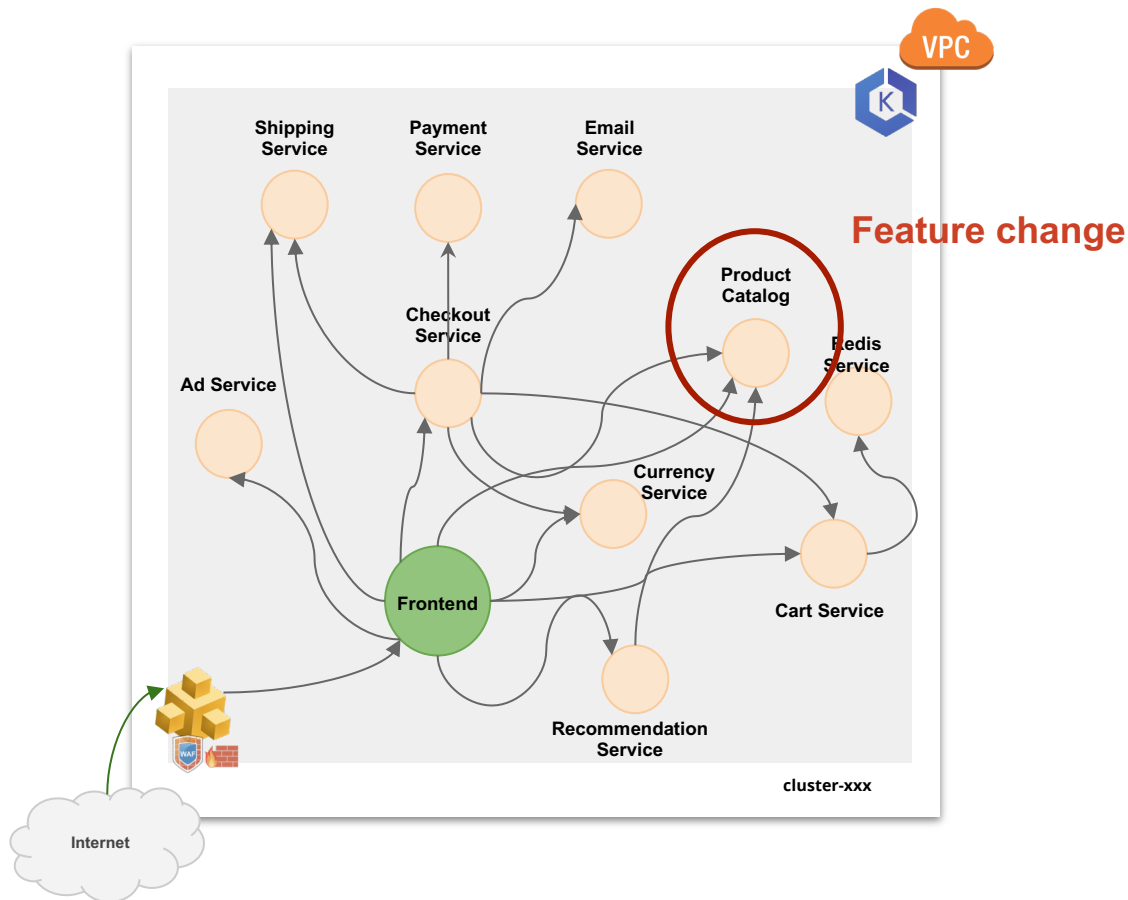

Developers

# Demonstration

# Hipster-shop (now Online Boutique) Application Topology

# Developer/DevSecOps Workflow: Discover & Secure API Access

- 1 Discover New and Existing API endpoints
- 2 Secure new API endpoints on *hipster-dev*
- 3 Enforce secure policy to *hipster-stage*

# Thank You!

## Q&A
